

A TMS FOR THE CHEMICAL INDUSTRY

Over **290 chemical companies** trust Kuebix with their transportation management.

Shipping chemicals isn't quite like shipping anything else. There are special considerations to take into account like product compatibility, axle weight distribution and different types of containers needed to carry product. The driver needs to be specially certified as well since the product being shipped can be hazardous and loading and unloading requires much more than a pallet jack.

Whether you're shipping standardized commodities or Haz-Mat specialty blends, at Kuebix we understand the complicated nature of your business and are ready to provide state-of-the-art TMS services to support your needs.

Features Our Chemical Partners Love

Product Compatibility

Product compatibility for every product is pre-loaded into the Kuebix database. Compatibility factors are automatically taken into account when building loads and dealing with hazardous materials. This reduces the risk of human error and ensures that the truck maintains safety standards throughout the delivery.

Intelligent Load Optimization

Kuebix's Load Optimizer enables chemical companies to intelligently cube out their trucks. The Optimizer takes into account the bulk quantities, compartment specifications and the weight of the truck. By digitally 'filling' compartments, the maximum effect can be achieved.

Route Optimization

After the load has been built, the route builder finds the best multi-stop route for delivering the product. An algorithm matches up addresses to minimize the overall duration of the route while taking into account product specifications to produce the lowest possible cost of freight.

Invoice Audit and ERP Integration

Shippers can integrate purchase orders directly from an ERP to Kuebix. This allows shipments to be automatically created and for the rapid creation of BOLs with proper hazmat notification. The entire freight pay and invoice audit process is automated with Kuebix. When invoices are ready to be paid, the system can audit each one to identify the specific exceptions which need to be reviewed.

Collaboration Portals

Cloud-based collaboration portals help chemical companies track the timing and delivery of shipments with suppliers and carriers. The portal serves as the dynamic record of truth for any changes that need to occur across the supply chain to keep the delivery of goods moving efficiently.

Connect Directly to Carriers

By connecting with Kuebix, chemical companies can book commodity cargo shipments directly with a full set of truckload carriers. With the ability to connect to Kuebix's extensive carrier network in minutes, shippers can begin realizing efficiencies immediately.

Inbound Management

With Kuebix's inbound management program, chemical companies can implement routing guides and Vendor Inbound Compliance programs to improve supplier behavior. Rate and unloading allowance programs along with LTL consolidation result in an overall reduction to cost of goods.

Reports and Analytics

All shipping transactions are captured and can be summarized and analyzed in reports and dashboards. Understanding financial analytics, carrier scorecards and shipment trends helps to strategically position chemical companies to reduce freight spend and improve customer service.
